detector including: thermal type infrared sensor (103) of which (105); a temperature electric characteristics are changed in accordance with changes in temperature caused through infrared absorption; heat-insulating supporting legs (102) for supporting the temperature sensor (103) in a heat-insulating manner and serving as signal lines for reading out electric signals (103); and an infrared the said temperature sensor layer (101) having thermal contact absorption temperature sensor (103), wherein each of the temperature sensor (103), the heat-insulating supporting legs (102) and the infrared absorption layer (101) is formed in different planes that are spatially apart from each other.
